DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-21 are rejected under 35 U.S.C. 102(e) as being anticipated by U.S. Patent Number 6,733,202 to Couture et al.

Couture discloses an apparatus for moving a latching pin a lateral distance having a rotatable grip handle means (16), a latching pin (14) connected to the rotatable handle means where a central axis of latching pin is substantially perpendicular to the rotatable handle (figure 1), and a latching pin guide means (22) that engages and guides the latching pin along the central axis in response to rotation of the handle, as in claims 1, 12, and 15.

Couture also discloses the latching pin having a cam pin (20) that engages the latching pin guide, as in claims 2, 13, and 16, where the cam pin is fixed to the latching pin perpendicular to the central axis of the latching pin and wherein the latching pin guide comprises a cam (43) disposed circumferentially about the latching pin and wherein the cam comprises a circumferential cam slot (50) that defines an arc (figures 4a, 4b, and 4c) having a lateral component equal to the lateral distance and a circumferential component equal to a predetermined amount of rotation of the rotatable handle, and wherein the cam pin protrudes through the cam slot and rides in the cam slot to guide the latching pin along the lateral distance

in response to rotation of the handle (column 4, line 65-column 5, line 30), as in claims 3, 14, and 17.

Couture further discloses a biasing spring (40) that urges the latching pin toward the latch position, as in claims 4 and 18, a keeper channel (26) into which a distal end of the latching pin extends, as in claim 5, wherein the cam pin is capable of protruding through the handle and the latching pin to fix the handle and latching pin together, as in claim 6, as well as the arc defined by the cam slot has a detent portion (62) at an end corresponding of the latch position to the latching pin, as in claims 7 and 19.

Couture additionally discloses the handle and latching pin are connected to a detachable panel (64), as in claim 8, wherein the handle is capable of being a carrying means for the detachable panel when it is detached, as in claim 9, and a grip (32) extension of the handle extends along an axis generally perpendicular to the central axis of the latching pin, as in claims 10 and 20, and the handle is rigidly connected (by means of 34) to the latching pin, as in claims 11 and 21.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following patents are cited to further show the state of the art with respect to latch assemblies with a camming means to retract the latch bolt:

U.S. Patent Number 6,416,244 to Huber, U.S. Patent Number 6,363,670 to Dewitt, U.S. Patent Number 5,186,197 to Lavine, U.S. Patent Number 4,781,407 to Rauchhaus, U.S. Patent Number 3,120,972 to Remke et al., U.S. Patent Number 2,136,854 to Knott.

Application/Control Number: 10/619,407

Art Unit: 3676
